

What is DISCIPLINA

- DISCIPLINA is the first multifunctional blockchain to create verified personal profiles based on academic and professional achievements. Our project aims to make quality changes in the field of education and recruiting and aid the effective use of blockchain technologies.
- DISCIPLINA will store the whole history of academic achievement of a person in blockchain, generating their personal score. It will allow recruiters to simplify the candidate search by their fields of expertise and skills required.
- The team consist of 45 people. Our team has a great experience in education and blockchain fields.
- This blockchain is being developed from scratch by TeachMePlease team and former developers of Cardano (ADA coin)

Market

According to [EdTechXGlobal, IBIS Capital]

Dynamics of growth of the EdTech share of the market

Annual market growth

Data Disclosure Algorithm

Private layer. The private segment does not allow any data except hashes to open access. This is done to store private and personal user data, as well as those materials that are protected by copyright or commercial confidentiality.

Witnesses check the validity of the segments within the private blockchains of the educational institutions. They will manage public chain of blocks, on which data created within each school is hashed. The witnesses won't have access to the data itself, only to the hashes of the data.

Educational institutions. An educational institution is any state or private online and offline organisation that conducts any and all educational activity. Private tutors are also included. It can even be a simple marketplace offering the sale of study materials. Every educational institution has its private chain and the opportunity to monetise educational records stored there.

Recruiters and other interested parties are offered paid access to the information about the academic history and achievements of the students.

Public layer. The public segment provides the access to the data that verifies the integrity of the private chains and the reliability of the data stored by the network.
